

**PYRIMIDO COMPOUNDS HAVING ANTIPROLIFERATIVE ACTIVITY**

**Priority to Related Applications**

**[0001]** This application claims the benefit of Provisional Application Serial No. 60/423,670, filed November 4, 2002.

**Field of the Invention**

**[0002]** The present invention is directed to novel pyrimido compounds that inhibit the Src family of non-receptor tyrosine kinases (SFKs). These compounds and their pharmaceutically acceptable salts have antiproliferative activity and are useful in the treatment or control of cancer, in particular solid tumors. In addition these compounds have advantageous bioavailability profiles. This invention is also directed to pharmaceutical compositions containing such compounds and to methods of treating or controlling cancer, most particularly the treatment or control of breast, colon, hepatic and pancreatic tumors.

**Background of the Invention**

**[0003]** Protein kinases are a class of proteins (enzymes) that regulate a variety of cellular functions. This is accomplished by the phosphorylation of specific amino acids on protein substrates resulting in conformational alteration of the substrate protein. The conformational change modulates the activity of the substrate or its ability to interact with other binding partners. The enzyme activity of the protein kinase refers to the rate at which the kinase adds phosphate groups to a substrate. It can be measured, for example, by determining the

amount of a substrate that is converted to a product as a function of time.  
Phosphorylation of a substrate occurs at the active-site of a protein kinase.

**[0004]** Tyrosine kinases are a subset of protein kinases that catalyze the transfer of the terminal phosphate of adenosine triphosphate (ATP) to tyrosine residues on protein substrates. These kinases play an important part in the propagation of growth factor signal transduction that leads to cellular proliferation, differentiation and migration.

**[0005]** For example, the Src family of non-receptor tyrosine kinases has been specifically implicated in cancer cell modulation and growth. See D. H. Boschelli and F. Boschelli, "Small molecule inhibitors of Src family kinases," *Drugs of the Future* **2000**, 25(7):717-736. Src over expression has been detected in colon, breast, hepatic and pancreatic tumors, as well as in certain B-cell leukemias and lymphomas. *Id* at 719. Increased Src expression and activity has also been shown to correlate with an increase in tumor malignancy. *Id* at 719. Thus, Src inhibitors can be useful as antitumor agents.

**[0006]** There are several examples of small molecule inhibitors of protein kinase catalytic activity. In particular, small molecule inhibitors typically block the phosphorylation of substrates by tightly interacting with the protein kinase ATP binding site (or "active site"). See WO 98/24432 and Hennequin L. F. et. al., *J. Med. Chem.* **2002**, 45(6), pp1300. Several of these compounds inhibit multiple targets. For example, WO99/61444 (Warner-Lambert) discloses bicyclic pyrimidines and bicyclic 3,4-dihydropyrimidines of formula

that are asserted to inhibit cyclin dependent kinases Cdk1, Cdk2 and Cdk4 as well as the growth factor receptor tyrosine kinase enzymes PDGFR and FGFR. Some compounds are also asserted to inhibit Cdk6.

**[0007]** US Patent No. 6,150,373 (Hoffmann-La Roche Inc.) discloses bicyclic nitrogen heterocycles of formula

that are stated to inhibit the T-cell tyrosine kinase p56<sup>lck</sup>.

**[0008]** WO 01/29041 A1 and WO 01/29042 (F. Hoffmann-La Roche AG) disclose alkylamino substituted bicyclic nitrogen heterocycles of formula

that are stated to inhibit p38 mediated cellular functions and are thus inhibitors of cellular proliferation.

**[0009]** WO 01/64679 A1 (SmithKline Beecham) discloses 1,5-disubstituted-3,4-dihydro-1H-pyrimido[4,5-D]pyrimidin-2-one compounds of formula

that are stated to be useful in treating CSBP/P38 kinase mediated diseases.

**[0010]** There continues to be a need for easily synthesized, small-molecule compounds effective in inhibiting the catalytic activity of protein kinases, in particular the Src family of non-receptor tyrosine kinases ("SFKs"), for treating one or more types of cancers, particularly solid tumors. It is preferable that such small molecule inhibitors also possess advantageous bioavailability profiles. It is thus an object of this invention to provide such compounds and pharmaceutical compositions containing these compounds.

**[0017]** "Alkynyl" denotes a straight-chain or branched aliphatic hydrocarbon having at least one set of carbon-carbon triple bond, for example ethynyl, and 2-butyne.

**[0018]** "Alkyl" denotes a straight-chain or branched saturated aliphatic hydrocarbon having 1 to 10, preferably 1 to 6, and more preferably 1 to 4 carbon atoms. Alkyl groups having 1 to 6 carbon atoms are also referred to herein as "lower alkyl." Typical lower alkyl groups include methyl, ethyl, propyl, isopropyl, butyl, t-butyl, 2-butyl, pentyl and hexyl. As used herein the sample designation C<sub>1-4</sub> alkyl means alkyl having from 1 to 4 carbon atoms.

211.48

**[0066]** To a solution of (±)-1-(2,4-dichloro-pyrimidin-5-yl)-ethanol (1.27 g, 6.60 mmol) (from Example 1a *supra*) in phosphorus oxychloride (5.0 mL, 53.11 mmol) (Aldrich), at 0 °C, was added diisopropylethyl-amine (2.60 mL, 14.78 mmol) (Aldrich). The reaction was stirred at 0 °C for 5 minutes, at ambient temperature for 15 minutes and then at 115 °C for 3 hours. After stirring for 10 minutes, the layers were separated and the aqueous extract was back washed with toluene. The combined organic extracts were dried over anhydrous sodium sulfate, filtered, and concentrated. Purification by flash chromatography (Biotage, 40M, 10:90 to 15:85 ethyl acetate - hexanes gradient) gave (±)-2,4-dichloro-5-(1-chloroethyl)-pyrimidine as an oil. (Yield 1.233 g; 88.3%).

**[0067]** A solution of (±)-1-(2,4-dichloro-pyrimidin-5-yl)-ethanol (0.50 g; 2.60 mmol) (from Example 1a *supra*) and diisopropylethylamine (1.10 mL; 6.25 mmol) (Aldrich) in dibromomethane (0.35 mL) was cooled to 15 °C. Phosphorus oxybromide (0.73 g; 2.83 mmol) was added in one portion. Cooling bath was removed and reaction mixture was stirred at room temperature. After 20

Ethyl 2-formylbutyrate

**[0069]** A solution of diisopropylamine (120.6 mL, 0.86 mol) (Aldrich) in tetrahydrofuran (370 mL) was cooled to -30 °C. *n*-Butyllithium (2.5 M in hexanes, 344.2 mL, 0.86 mol) (Aldrich) was added drop wise at such a rate that the reaction mixture temperature was kept between -30 to 0 °C. The reaction mixture was then cooled to -75 °C in a dry ice - acetone bath. A solution of ethyl butyrate (100 g, 0.86 mol) (Aldrich) in tetrahydrofuran (170 mL) was added drop wise over 28 minutes and keeping the reaction temperature between -75 to -70 °C. The mixture was stirred at the same temperature for an additional 30 minutes. Ethyl formate (125 mL, 1.55 mol) (Aldrich) was then added to this mixture over 25 minutes and maintaining the temperature between -75 to -70 °C. The resultant mixture was allowed to warm to room temperature and stirred at room temperature for 3 hours. With external cooling in a cold water bath to keep the reaction temperature below 30 °C acetic acid (98.55 mL, 1.72 mol) was added, followed by water (430 mL) and dichloromethane (200 mL). After separating the layers, the organic layer was washed with water (300 mL). The combined water layer was extracted with dichloromethane (200 mL). The

combined organic layer was washed with aqueous sodium bicarbonate solution (200 mL). The basic aqueous solution was extracted with dichloromethane (100 mL). All organic layers were then combined, dried over sodium sulfate over night, filtered and distilled to remove solvent leaving about 180 mL. (Some of the product was distilled over with tetrahydrofuran.) The residue was distilled at 65 - 81 °C (23 mm Hg). The fraction distilling over at 70 - 81 °C (23 mm Hg) gave ethyl 2-formylbutyrate. **[0087]** 0.25 g of the product from Example 11a, *supra*, were dissolved in 10 mL chloroform and 0.30 g thionyl chloride were added drop-wise. The mixture was refluxed for 2 hrs and evaporated to yield 0.31 g of the title product as the hydrochloride salt.

### Example 11c

5-[1-(2-Bromo-phenylamino)-ethyl]-2-methylsulfanyl-pyrimidin-4-yl-methyl-amine

**[0088]** 0.25 g of the product from Example 11b, *supra*, and 34 mg sodium iodide in 10 mL acetonitrile were stirred for 15 min at RT. The resulting suspension was added drop-wise at RT to a mixture of 0.21 g 2-bromoaniline (Aldrich) and 0.33 g N-ethyl-di-isopropyl amine (Aldrich) in 5 mL acetonitrile. Stirring was continued for 16 hrs and the mixture was diluted with 20 mL water and extracted with dichloromethane. Chromatography on silica (eluent CHCl<sub>3</sub>) yielded 158 mg of the title product.

### Example 11d

3-(2-Bromo-phenyl)-1,4-dimethyl-7-methylsulfanyl-3,4-dihydro-1H-pyrimido[4,5-d]pyrimidin-2-one (enantiomers 1 + 2)

**[0089]** To 1.1 g of the product from Example 11c, *supra*, in 10 mL dry DMF were added 0.236 g sodium hydride (95%) with cooling. After stirring for 20 min at RT, the mixture was cooled to 5 °C and treated in small portions with a total of 1.01 g carbonyldiimidazole (Aldrich). Stirring was continued at 5 °C for 30 min and at RT over night. Excess sodium hydride was then destroyed by addition of a small amount of water under cooling. The mixture was diluted with water, extracted with ethyl acetate and the combined organic phases evaporated. The crude product was chromatographed on a chiral phase Chiracel OD-CSP (commercial 20 µm material from Daicel, eluent heptane / iso-propanol 1:1) to yield 470 mg each of the separated enantiomers of the title product as pale yellow powders. The first eluting enantiomer is termed "enantiomer 1", and likewise the corresponding enantiomer of the chiral compounds derived from it in the following preparation examples are termed "enantiomer 1". The second eluting enantiomer is termed "enantiomer 2", and likewise the corresponding enantiomer of the chiral compounds derived from it in the following preparation examples are termed "enantiomer 2".

### **Example 11e**

3-(2-Bromo-phenyl)-7-methanesulfonyl-1,4-dimethyl-3,4-dihydro-1H-pyrimido[4,5-d]pyrimidin-2-one; enantiomer 1

**[0090]** 0.628 g meta-chloroperbenzoic acid (77%) (Aldrich) were dissolved in 50 mL CH<sub>2</sub>Cl<sub>2</sub> and this solution was dried by filtration over sodium sulfate. The dried MCPBA solution was added to a solution of 0.437 g of the enantiomer 1 from Example 11d, *supra*, in 20 mL CH<sub>2</sub>Cl<sub>2</sub> dropwise at RT and stirring was continued over night. Excess peracid was destroyed by washing with dilute sodium bisulfite solution. The organic phase was washed with aqueous sodium bicarbonate, dried, and evaporated. Chromatography over silica in ethyl acetate / heptane yielded 430 mg of the title product.

### **Example 11f**

3-(2-Bromo-phenyl)-7-[4-(2-diethylamino-ethoxy)-phenylamino]-1,4-dimethyl-3,4-dihydro-1H-pyrimido[4,5-d]pyrimidin-2-one (enantiomer 1)

**[0091]** 152 mg of 4-(2-diethylamino-ethoxy)aniline (prepared according to Rohmann, Friedrich, Chem. Ber. (1939) **72**: p.1333) in 1 mL dry NMP were treated with 0.43 mL of a 2M solution of HCl in ether and stirred at RT for 30 min. 100 mg of the product of Example 11e, *supra*, were added and the mixture was heated to 120 -130 °C for 16 hrs. The mixture was diluted with 10 mL water and adjusted to alkaline pH by addition of NaOH. Extraction with CH<sub>2</sub>Cl<sub>2</sub> and concentration of the organic phases gave a crude oil from which NMP and excess aniline were distilled off under high vacuum in the Kugelrohr oven. The residue was dissolved in 0.1 mL methanol and slowly diluted with 0.5 mL water. A fine precipitate formed, which was isolated by centrifugation and eventually purified further by preparative HPLC-MS. Yield 20 mg of the title product.

#### Peptides:

NH<sub>2</sub>-A-E-E-E-I-Y-G-E-F-E-A-K-K-K-K-CONH<sub>2</sub> , and  
Ja133-G-Aminocaprylic acid-A-E-E-E-I-Y-G-E-F-E-A-K-K-K-K-CONH<sub>2</sub>, wherein Ja133 is *LightCycler-Red 640-N-hydroxy succinimide ester<sup>TM</sup>*;

whereby both peptides were synthesized by an optimized solid phase peptide synthesis protocol (Merrifield (1962) Fed. Proc. Fed. Amer. Soc Exp. Biol. 21, 412) on an Zinsser SMP350 peptide synthesizer. Shortly, the peptide was assembled on 160 mg (22.8  $\mu$ mol scale) of a Rink-Linker modified polystyrene solid phase by repeatedly conjugating a twenty fold excess of aminoacids each protected by temporary piperidine labile Fmoc- and permanent acid labile tert-Bu-, BOC- and O-tert-Bu-groups depending on the side chain function. The substrate sequence AEEEIYGEFEAKKKK was N-terminal additionally mounted with the spacer amino acids Aminocaprylic acid and Glycin. After cleavage of the

N-terminal temporary protecting group the still attached and protected peptide was labeled with a 1.5 fold amount of *LightCycler-Red 640-N-hydroxy succinimide ester* (purchased from Roche Diagnostics GmbH) and triethylamine. After 3 hrs. the resin was washed with dimethylformamide and isopropanol until the eluates of the blue resin got colourless. The fully protected and labeled peptide was removed from the solid phase and released from the permanent protecting groups by treatment with a mixture of 80% trifluoroacetic acid, 10% ethanedithiol, 5% thioanisole and 5% water. The substrate was finally isolated by a preparative reverse phase HPLC purification. The purification yielded 12.2 mg RP-HPLC single peak pure blue material (lyophilisate). The identity was proven by MALDI mass spectroscopy [2720.0].

Enzymes: Upstate Lck (p56<sup>lck</sup>, active), Upstate Src (p60<sup>c-src</sup>, partially purified) were purchased from UBI.

Homogenous, time-resolved Fluorescence Assay: Reader: Perkin Elmer, Wallac Victor 1420-040 multilabel counter; Liquid handling system: Beckman Coulter, Biomek 2000.

ATP, Tween 20, HEPES were purchased from Roche Molecular Biochemicals, MgCl<sub>2</sub> and MnCl<sub>2</sub> were purchased from Merck Eurolab, TCEP was purchased from Pierce, 384 Well low volume fluorescence plates was purchased from Falcon.

#### **Assay Description:**

**[0095]** At first the enzyme is pre-incubated for 15 min. at 15 °C in aqueous solution with corresponding amounts of inhibitors according to this invention. Then the phosphorylation reaction is started by adding a reaction mixture, containing ATP, Peptide and PT66, and subsequent shaking. The proceeding of

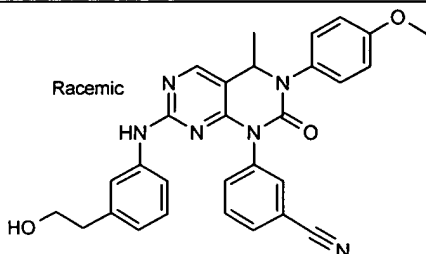

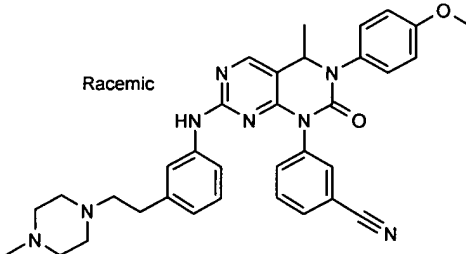

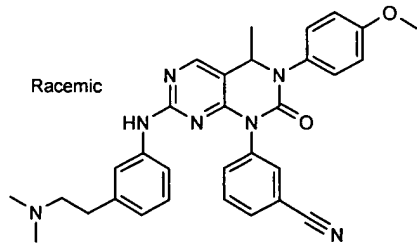

this reaction is immediately monitored using time resolved fluorescence spectroscopy in a suitable well plate reader.
